

**OFFICIAL BREED STANDARD
of the
KENNEL UNION OF SOUTHERN AFRICA**

DOBERMANN

APPLICATION

Companion, protection and working dog.

BRIEF HISTORICAL SUMMARY

The Dobermann is the only German breed which bears the name of its original breeder, Friedrich Louis Dobermann (02.01.1834 - 09.06.1894). He was believed to be a tax collector, offal abattoir manager (knacker) and a part-time dog catcher, legally able to catch all stray dogs. He bred with animals from this reservoir that were particularly sharp. The so-called 'butcher's dogs' which were already considered a relatively pure breed at that time, played a most important role in the origination of the Dobermann breed. These dogs were an early type of Rottweiler, mixed with a type of shepherd which existed in 'Thüringen' as a black dog with rust red markings. Herr Dobermann bred with this mixture of dogs in the Eighteen Seventies. Thus he obtained 'his breed' - not only alert but highly protective working and housedogs. They were often used as guard and police dogs. Their extensive use in police work led to the nickname 'Gendarme dog'. They were used in hunting to control large vermin. In these circumstances it was a matter of course that the Dobermann was recognised officially as a Police Dog by the beginning of the century.

The Dobermann breed requires a medium sized, powerful, muscular dog. Despite his substance, he shall be elegant and noble, which will be evident in his body line. He must be exceptionally suitable as a companion, protection and working dog and also as a family dog.

GENERAL APPEARANCE

The Dobermann is of medium size, strong and muscularly built. Through the elegant lines of its body, its proud stature, and its expression of determination, it conforms to the ideal picture of a dog.

IMPORTANT PROPORTIONS

The body of the Dobermann appears to be almost square, particularly in males. The length of the body measured from the point of the shoulder to the point of the buttock shall not be more than 5% longer than the height from the withers to the ground in males and 10% in females.

BEHAVIOUR AND TEMPERAMENT

The disposition of the Dobermann is friendly and calm; very devoted to the family, it loves children. Medium temperament and medium sharpness (alertness) is desired. A medium threshold of irritation is required with a good contact to the owner. Easy to train, the Dobermann enjoys working and shall have good working ability, courage and hardness. The particular values of self confidence and intrepidity are required and also adaptability and attention to fit the social environment.

HEAD

Cranial Region

Strong and in proportion to the body. Seen from the top, the head is shaped in the form of a blunt wedge. Viewed from the front the crown line shall be almost level and not dropping off to the ears. The muzzle line extends almost straight to the top line of the skull which falls, gently rounded, into the neck line. The superciliary ridge is well developed without protruding. The forehead furrow is still visible. The occiput shall not be conspicuous. Seen from the front and the top, the sides of the head must not bulge. The slight bulge between the rear of the upper jawbone and the cheek bone

shall be in harmony with the total length of the head. The head muscles shall be well developed.

Stop

Shall be slight but visibly developed.

FACIAL REGION

Nose

Nostrils well developed, more broad than round, with large openings without overall protrusion. Black - on black dogs; on brown dogs, corresponding lighter shades.

Muzzle

The muzzle must be in the right proportion with the upper head and must be strongly developed. The muzzle shall have depth. The mouth opening shall be wide, reaching to the molars. A good muzzle width must also be present on the upper and lower incisor area.

Flews

They shall be tight and lie close to the jaw which will ensure a tight closure of the mouth. The pigment of the gum to be dark; on brown dogs a corresponding lighter shade.

Jaw/Dentition/Teeth

Powerful broad upper and under jaw, scissor bite, 42 teeth correctly placed and normal size.

Eyes

Middle sized, oval and dark in colour. Lighter shades are permitted for brown dogs. Close lying eyelids. Eyelids shall be covered with hair. Baldness around the rim of the eye is highly undesirable.

Ears

In a country where cropping is not permitted the uncropped ear is equally recognised. (Medium size preferred and with the front edge lying close to the cheeks).

NECK

The neck must have a good length and be in proportion to the body and the head. It is dry and muscular. Its outline rises gradually and is softly curved. Its carriage is upright and shows much nobility.

BODY

Withers

Shall be pronounced in height and length, especially in males and thereby determine the slope of the topline rising from the croup to the withers.

Back

Short and tight, of good width and well muscled.

Loin

Of good width and well muscled. The bitch can be slightly longer in loin because she requires space for suckling.

Croup

It shall fall slightly, hardly perceptible from sacrum to the root of the tail and appears well rounded, being neither straight nor noticeably sloping, of good width and well muscled.

Chest

Length and depth of chest must be in the right proportion to the body length. The depth, with slightly arched ribs, should be approximately 50% the height of the dog at the withers. The chest has got a good width with an especially well developed forechest.

Underline

From the bottom of the breastbone to the pelvis the underline is noticeably tucked up.

Tail

It is high set and docked short whereby approximately two tail vertebrae remain visible. In countries where docking is legally not permitted, the tail may remain natural. Customarily docked.

LIMBS

FOREQUARTERS

General

The front legs as seen from all sides are almost straight, vertical to the ground and strongly

developed.

Shoulders

The shoulderblade lies close against the chest and both sides of the shoulderblade edge are well muscled and reach over the top of the Thoracic Vertebra, slanting as much as possible and well set back. The angle to the horizontal is approximately 50%.

Upper Arm

Good length, well muscled, the angle to the shoulderblade is approximately 105° to 110°.

Elbow

Close in, not turned out.

Lower Arm

Strong and straight. Well muscled. Length in harmony with the whole body.

Carpus

Strong.

Metacarpus

Bones strong. Straight seen from the front. Seen from the side, only slightly sloping, maximum 10°.

Front Feet

The feet are short and tight. The toes are arched towards the top (cat like). Nails short and black.

HINDQUARTERS

General

Seen from the back the Dobermann looks, because of his well developed pelvic muscles in hips and croup, wide and rounded off. The muscles running from the pelvis towards the upper and lower thigh results in good width development, as well as in the upper thigh area, in the knee joint area and at the lower thigh. The strong hind legs are straight and stand parallel.

Upper Thigh

Good length and width, well muscled. Good angulation to the hip joint. Angulation to the horizontal approximately between 80° to 85°.

Knee

The knee joint is strong and is formed by the upper and lower thigh as well as the knee cap. The knee angulation is approximately 130°.

Lower Thigh

Medium length and in harmony with the total length of the hindquarter.

Hock Joint

Medium strength and parallel. The lower thigh bone is joined to the Metatarsal at the hock joint (angle about 140°).

Metatarsus

It is short and stands vertical to the ground.

Hind Foot

Like the front feet, the toes of the back feet are short, arched and closed. Nails are short and black.

GAIT

The gait is of special importance to both the working ability as well as the exterior appearance. The gait is elastic, elegant, agile, free and ground covering. The front legs reach out as far as possible. The hindquarter gives far reaching and necessary elastic drive. The front leg of one side and back leg of the other side move forward at the same time. There should be good stability of the back, the ligaments and the joints.

SKIN

The skin fits closely all over and is of good pigment.

COAT

Hair

The hair is short, hard and thick. It lies tight and smooth and is equally distributed over the whole surface. Undercoat is not allowed.

Colour

Fearful, nervous and aggressive animals.

Size

Dogs which deviate more than two centimetres over or under the standard.

NOTE

Male animals should have two apparently normal testicles fully descended into the scrotum.
